Jests HD Medieval Adventure

Why we are building it, where it stands, and what comes next. The town of Bellmire, 8 November 2026.

Repository	github.com/jestsayin96/Bellmire-HD-stream (public, branch main)
Project folder	C:\hd adventure\jests-hd-medieval-adventure
Engine	Godot 4.7.2 at D:\1game\Godot_v4.7.2-stable_win64.exe
To play	Double-click **Play Jests HD.bat** in the project folder, or open project.godot in Godot and press F5

1. Why we are doing this game

JestSayin96 is a variety streamer, and Twitch is home base. Variety channels have a hard time giving viewers a reason to stick around between games. This game is that reason: one world that belongs to the channel, and every viewer can live in it.

- **Viewers become heroes.** They enlist from chat, gear up at the smithy and armoury, delve into the scar, level up, die for good, and are written into the town's chronicle and the guild roll. A death is a story the chat saw happen.
- **The world runs on its own.** Bellmire works, trades, eats, gets raided and rebuilds whether or not anyone types. That makes it a backdrop that can carry a just-chatting segment, a BRB screen, or a whole stream.
- **It turns watching into taking part.** Chat commands, and later follows, subs and channel points, become things that happen on screen. That gives people a reason to come back, to talk in chat, and to follow.
- **It makes clips by itself.** Boss kills, a last-second death save, a lantern going out on floor 7, a raid burning the town: short, funny or dramatic moments that suit the vertical-clip pipeline.
- **It is his own.** It is a sequel to his first game, "trial and error" (Jests Medieval Adventure), not a stock overlay. It fits the jester brand and it can grow for years.

Why an HD rebuild

The original game in "trial and error" has the systems and the lore, but it looks flat: untextured blocks on hex plates. The HD rebuild keeps the rules and the lore (ported, not invented) and replaces the look with the Quaternius Medieval MegaKit (real-metre half-timbered houses, cobbles, clay roofs). It also gets a new interface in an RTS / World of Warcraft style. The original's interface was deliberately not brought over. KayKit characters stay as they are.

2. What is built and working

Area	State today
Bellmire (the town)	Generated valley town: districts, landmarks (Chief's Hall, chapel, barracks, windmill, watermill, granary, workshops, sawmill, mine, archery range), walls with gates and towers, river and bridge, fields and farms, the scar with the guild post. As of today no house stands on a road, and every block has grass in the middle.
Townsfolk	Around 140 people: trades with homes and workplaces, peasants, children, guards, fishers on the docks, animals. Since today they walk on a Godot navmesh, so they go around houses, stalls, tables, the wall and the river. Guards and stall-keepers look around and gesture.
Economy (ported)	Stock and prices, daylight production, end of day (food, tax, wages), settlers, the chief's spending, hunger and starving, town level and tier, caravans.
Raids (ported)	From town level 3: scar skeletons or bandits; guards, the chief and heroes defend; houses burn and get rebuilt.
Heroes	9 classes with 5e stats, AC, death saves and permadeath; guild ranks; gear tiers that show on the body; spells; the town's own band of adventurers; fishing; viewer save file.
The delve	Party musters at the scar; generated floors with themes, biomes and origins, monsters and floor lords; lantern oil, loot, renown; one death save; the walk home. Floors chain on, and no floor count is ever stated (canon).
Interface (new)	RTS camera (pan, zoom, rotate, jump keys), click to select, F to follow, a WoW-style unit frame, the Chronicle feed, name tags, health bars on anyone fighting or hurt, local chat box.
Day and night	90-second days, sun arc, warm dusk, moonlit nights (brightened today so the stream stays watchable), lamps and glowing windows.
Chat commands	!enlist, !delve, !fish, !inventory, !reroll, leaderboard and memorial lists, and more. Typed into the local chat box for now.
Quality	Headless test tools for delves, walls and clipping, raids, health bars, a 10-day soak, selection and inventory. All passing on 4.7.2, 0 script errors.

3. What still needs to be built

Ordered by what matters most for going live with it.

#	Build	Why it matters
1	**Live Twitch connection**: read real chat (IRC/EventSub), then follows, subs, bits and channel-point redeems as game events.	Today chat is local only. Without this it is not a stream game yet. The roster already has the hooks for these rewards.

#	Build	Why it matters
2	**Stream mode / auto-director camera**: cut to fights, deaths, boss rises, raids and catches; return to the square when quiet; a clean 'no UI' layout for OBS.	He streams other games too; Bellmire has to run unattended and stay watchable.
3	**On-screen leaderboard and guild roll panel**, plus a memorial wall of the fallen.	This is where viewers come back to see themselves. It exists only as chat lists today.
4	**Sound**: music by time of day, town ambience, combat, spells, the raid horn, a death sting.	The game has no audio at all yet. The test recordings were silent.
5	**Party frames and a minimap** (WoW style): every delving hero's HP and oil at a glance; a map with heroes, the scar and raids.	Lets viewers follow their hero without clicking around.
6	**Put the new props pack to use** (49 new Quaternius props, already imported): lanterns and barrels by doors, tavern chairs, books and candles at the chapel, chains, cages and candlesticks in dungeon rooms.	More detail where the camera spends its time.
7	**Phase B: monsters and bosses**: finish the rotating bosses and creature strains from the lore so deeper floors feel different.	Variety on long streams; boss nights as events.
8	**Icons and art** from Adobe Firefly: item and spell icons for the unit frame, a parchment panel, a title or loading screen.	Already covered by his Adobe plan.
9	**Hero growth from chat**: class change and stat reroll at the guild, shop browsing from chat, more ways to spend gold.	Gives viewers decisions to make, not just a button to press.

4. What needs improvement

Area	What is wrong or weak	Next step
Town layout	Better since today, but blocks are still sparse (67 houses) and streets are very wide. The town reads as a scatter more than a market town.	Denser terraces along the main streets, narrower lanes, more house shapes from the MegaKit.
Town life	Many people are indoors at once, and walking crowds are thin away from the square.	Shorter indoor stays, errands that cross town, chats between passers-by, carts on the roads.
Clipping (town)	Down from 2.7% to under 1% of walking time inside a house or prop. The rest is doorsteps and the crowded inn yard.	Thin out the inn yard props; add local avoidance between people.

Area	What is wrong or weak	Next step
Dungeon detail	Rooms are cleaner now (no clutter in corridors, no candle carpet, no void holes, working lava pits) but still plain.	Themed set-pieces per room (armoury, library, shrine, cells), using the new props.
Health bars and names	In a tight party the bars overlap each other; names stack but get tall with 5+ heroes.	Offset bars like names; party frames (above) take the load off.
Camera	Following a hero at night into dark fields shows mostly black; zoomed in, the view clips into walls.	Collision for the follow camera, a soft fill light around the followed hero.
Balance	A level-1 viewer hero dies fast in raids.	Fresh heroes stand back from raids until level 3, or get a first-death grace.
Character style	KayKit chibi characters next to realistic MegaKit houses is a visible style gap.	His call: kept unchanged for now; the Quaternius character packs are the option.

5. Ground rules (his standing decisions)

- Follow the lore of the original; port its systems and rules, do not invent canon. Never state a dungeon floor count.
- Do not bring the old interface over; build a new RTS / WoW-style one.
- The original "trial and error" folder is read-only.
- Never clear Mr. E's open Blender scene.
- Work in cycles: build, render, look at every image, revise, log it in PROGRESS.md. Commit and push only when he says so.

6. Suggested order from here

- **Next:** live Twitch chat (read-only first), the auto-director stream mode, and the leaderboard panel. That is the minimum to put Bellmire on stream.
- **Then:** sound, party frames and minimap, the props pass in town and dungeon.
- **Then:** Phase B bosses and strains, Firefly icons, channel points, subs and follows as in-game events.

Full build history: PROGRESS.md (cycles 1–47). Design: docs/PLAN.md. How to run and test: docs/RUNNING.md.
